Maintenance Buddy

Vehicle Maintenance Tracking App

Team members: Jordan Glatz, Ashton Hull, Daniel Vincent

Problem

- Keeping track of personal vehicle records can be hard without proper organization.
- Receipts get misplaced, invoices are scattered, and it can be hard to remember everything that has been done to the car.
- This can make problems arise when trying to sell the car, negotiating repairs, handling warranty issues, and disputing questionable work.

Solution

- A mobile app that keeps all vehicle records in one place
- Upload and store receipts, invoices, and photos
- Easy access to records for selling, repairs, and warranties

Product perspective

- Current tools (CARFAX, FIXD, spreadsheets, notebooks) can be inconsistent and hard to manage
- Maintenance Buddy keeps all vehicle data, history, and future services in one place
- Helps users stay organized with reminders and scheduling
- Automatically builds a clear maintenance timeline
- Stores notes, photos, and receipts safely

Product features

1. When adding a vehicle, users select a fuel type (petrol, diesel, hybrid, or electric) and are presented with a default maintenance schedule based on that type. Users can customize the schedule by adjusting each service's mileage interval using increment/decrement controls (±1,000 and ±5,000 miles). Users may also add or remove services. The resulting schedule is saved as the vehicle's required services.

2. The app can send reminders to schedule maintenance appointments by comparing the vehicle's required services and the estimated current mileage since last service.

Product features

3. Upon receiving a scheduling reminder, users may create appointment entries. Appointment entries do not allow you to schedule appointments within the app. Instead, they are meant to be done after the user has already scheduled the appointment externally. Appointment entries must contain a date and time for a follow-up. They may optionally contain information like "Service being performed", "Company Title," etc.

4. When creating or completing a service event, users may attach up to 3 photos (PNG/JPEG) and 1 document (PDF/TXT) to the entry. Each attachment is limited to 10MB. These attachments are stored securely and can be viewed alongside the service event details.

Product features

5. When the time for a follow-up comes, the app will send a reminder letting the user know that it is time to document the service.

6. Users may view their vehicle's maintenance history on a timeline and expand a "service event" to view the full details.

7. While viewing the maintenance history, appointment entries will show up on the timeline. Upon completion of the follow-up, they will become a service event.

Product features

8. If users do not want to use the appointment entry and appointment reminder features, they may opt to manually create the service event instead. Users will select the date the service occurred.

9. When creating a service event manually, users may select options including but not limited to: 1) "I did this service myself." 2) "Cosmetic modification", 3) "Performance modification"

Product features

10. Users may export complete maintenance history. This may come in two forms:

"Maintenance Summary" (PDF): Condensed version of the vehicle history limited to the most recent 30 services, includes mostly text. Users may export a summary for a single vehicle or all vehicles combined.

"Full Report" (ZIP Archive): Package containing full, unmodified vehicle history including all attachments. The archive is organized with a summary file, vehicle data, service records, and an attachments folder.

Product features

11. The app includes a dedicated notification center where users can view notifications separated into "Unread" and "Earlier" sections. Tapping a notification navigates the user to the related vehicle. Users can mark individual notifications as read or mark all as read at once. An unread count badge is displayed on the notifications tab.

12. Users may view and manage their vehicle's required services on a dedicated screen. For each service, users can see when it is due based on the mileage interval, edit the mileage interval, and enable or disable individual services. This allows users to fine-tune their maintenance schedule after the initial vehicle setup.

Product features

13. The main dashboard displays all of the user's vehicles and shows upcoming appointments across all vehicles. Users can quickly navigate to any vehicle's profile or add a new vehicle from the dashboard.
